

What do the following objects have in common?

THE EARTH IS ONE LARGE MIXTURE OF MOLECULES IN GASES, LIQUIDS AND SOLIDS.

Give up? They are all made up of atoms and molecules, which means, they are all types of _____
 So basically, everything in the universe is matter. Cupcakes are matter, baby elephants are matter, 8th graders are matter. Matter is everything around you. Matter is anything made of atoms and molecules. As of 1995, scientists have identified _____ states of matter - we will talk about these later. Matter is also anything that has _____ and _____
 Let's take this carrot: Let's get closer and closer to the smaller parts of the carrot-carrot atoms! These small parts of the carrot are called _____. Anything you see and can feel is made of atoms. All atoms are too small to be seen with the naked eye or even a microscope, although there are some new types of microscopes that are now able to see larger atoms such as gold. Matter is made up of atoms! All matter is the same because all _____
 Matter is also different because objects can be made up of different kinds of atoms. Gold is made of one kind of atom-gold atoms. Salt is made up of two different kinds of atoms-sodium atoms and chloride atoms.

Mass is how much there is of an object. Mass is related to how much something weighs. Mass and weight are two different things. The unit for mass is a gram. A nickel has the mass of about one gram. Objects that take up space and have mass are called _____. Everything around you is made up of matter. Chocolate cake is made up of matter. You are made of matter. If you are having trouble understanding matter, look all around you. You can see matter makes up the walls of your house and your classroom. Matter is large and matter is small.

M is for Mass

Mass is the _____ in an object. Mass is also affected by gravity. _____ is a force of attraction between two objects. This force causes all objects to “pull” towards each other. The more mass two objects have; the stronger the pull. The closer the objects are to each other; the stronger the pull.

How are mass & weight different?

<p>A measurement of the amount of matter in a object (grams).</p>  <p>Mass is . . .</p> <ul style="list-style-type: none"> • a measure of the amount of matter in an object. • always constant for an object no matter where the object is in the universe. • measured with a balance (shown below). • expressed in kilograms (kg), grams (g), and milligrams (mg). 	<p>A measurement of the gravitational force of attraction of the earth acting on an object.</p>  <p>Weight is . . .</p> <ul style="list-style-type: none"> • a measure of the gravitational force on an object. • varied depending on where the object is in relation to the Earth (or any other large body in the universe). • measured with a spring scale (shown above). • expressed in newtons (N). 	<p>What about weight? Weight is the measure of _____ on an object. Compare a brick to a sponge. The brick has mass. Earth has mass. Therefore, the brick and Earth are attracted to one another. The weight of the brick is a measure of this attraction by Earth. Now look at the sponge. It is the same <i>size</i> as the brick, but its <i>mass</i> is less. Therefore, the sponge's attraction to Earth is less. <u>It's weight</u> is also less than the brick.</p> <p>Massive Confusion On Earth, gravity is the same everywhere. <u>Sooo . . .</u> On Earth, mass and weight <u>are</u> the same thing. BUT, if you were to go to the moon, they would be different. The moon has less gravitational pull, so the attraction between you and the moon would be less. On the moon, your weight is less. Your mass remains the same though.</p>	<p>Figure 6 How Mass and Distance Affect Gravity Between Objects</p>  <p>a Gravitational force (represented by the width of the arrows) is large between objects with large masses that are close together.</p> <p>b Gravitational force is smaller between objects with smaller masses that are close together than between objects with large masses that are close together (as shown in a).</p> <p>c An increase in distance reduces gravitational force between two objects. Therefore, gravitational force between objects with large masses (such as those in a) is less if they are far apart.</p>

Chp 2: Lect 2 : Properties of Matter: V is for Volume Student copy

Briefly, volume is the _____ something takes up. Whether it's a speck of dust or Jupiter, all matter takes up space.

Measuring the volume of...

<p>Graduated cylinder Displacement method Measured in liters (L) & milliliters (mL)</p>		<p>Length x width x height</p> 	<p>Since a gas expands to fill its container, if you know the volume of the container, you know the volume of the gas.</p>	
-----------------------------------------------------------------------------------------------------	-----------------------------------------------------------------------------------	------------------------------------------------------------------------------------------------------------------	----------------------------------------------------------------------------------------------------------------------------	-------------------------------------------------------------------------------------

<p>The mass of a substance divided by its volume. Density is an important physical property. Density is the mass of a substance per unit volume. Volume is the amount of space an object occupies.</p>		<p>Properties that do depend on the amount of matter present. A measurement of the amount of space a substance occupies.</p>

Physical Properties

Investigate: Paper Bag Secrets

List your observations without looking in the bag.

Did you properly identify the object? If so, how? If not, why not?

What do you think the object is? _____

How can you describe them if you didn't know what they were? Describing objects by using : _____

_____ uses an object's _____. It doesn't matter what your object was, everyone used similar descriptions. What were some of the "properties" you listed about your object? Size, Weight & Mass, Shape, Odor, Sound, etc. After opening your bag, you were able to list even more properties such as color, texture, etc.

Common Physical Properties

Physical properties can be observed or measured _____ changing the identity of the matter.

Basically, properties you notice when using one of your five senses: Feel - **mass, volume, texture** Sight - **color**, Hear, Smell, Taste

Physical properties of matter are categorized as either: _____

_____ Properties that do not depend on the amount of the matter present.

_____ How shiny a substance is.

_____ - The ability of a substance to be beaten into thin sheets.

_____ - The ability of a substance to be drawn into thin wires.

_____ - The ability of a substance to allow the flow of energy or electricity.

_____ - How easily a substance can be scratched.

_____ The temperature at which the solid and liquid phases of a substance are in equilibrium at atmospheric pressure.

_____ - The temperature at which the vapor pressure of a liquid is equal to the pressure on the liquid (generally atmospheric pressure).

Density is a very important property. It is the amount of matter in a given volume. _____

$$\text{Density (g/mL or g/cm}^3\text{)} \rightarrow D = \frac{m}{V}$$

Mass (kg or g)
Volume (mL or cm³)

Properties of all objects : _____ All objects take up space. Your computer is taking up space on the desk. You are taking up space on the chair. Remember all objects take up space and have mass. You use your sense of taste and smell to tell the difference between spinach and an orange.

The measurement of mass and other characteristics that can be seen without changing how that object looks are its physical properties. When you look at oranges, you know that they are oranges because of their color, shape, and smell. Mass, color, shape, volume, and density are some physical properties. The answers to the question about the present are physical properties. **A property describes how an object** _____

Properties are constantly changing... Matter is constantly changing. Ice in your soda melts, glass breaks, paper is ripped. When ice in your soda melts where does it go? What does it become?

**Physical vs. Chemical Properties:
Physical vs. Chemical Properties:**

Physical properties:

observe without changing the identity of the substance

Chemical properties:

observe only when the identity changes

How do you know if it is chemical or physical?

If it CHANGES, it's Chemical

Chemical properties

A common chemical property is _____.

Reactive to oxygen. Reactive to air. Reactive to water...

Notice that chemical properties aren't EASY to observe, unlike physical properties.

Comparing Physical and Chemical Properties

Substance	Physical property	Chemical property
Helium	less dense than air	nonflammable
Wood	grainy texture	flammable
Baking soda	white powder	reacts with vinegar to produce bubbles
Powdered sugar	white powder	does not react with vinegar
Rubbing alcohol	clear liquid	flammable
Red food coloring	red color	reacts with bleach and loses color
Iron	malleable	reacts with oxygen
Tin	malleable	reacts with oxygen

Physical Changes:

More Examples of Physical Changes

- Freezing water for ice cubes
- Sanding a piece of wood
- Cutting your hair
- Crushing an aluminum can
- Bending a paper clip
- Mixing oil and vinegar

Changes in matter that do not alter the identity of the matter itself. Changes that _____ the identity of the substance.

You may or may not be able to undo a physical change. For example: 1. Size 2. Shape 3. State - solid liquid gas 4. Dilutions. The water doesn't turn into soil or macaroni. It remains water.

If it did change into soil or macaroni, your drink would taste terrible and you would have an example of a _____ If you remember, ice is water in the solid state. When you drop the ice cube into the liquid, it begins to melt because the temperature is higher than that of the ice cube. It's like putting a snowman on your front lawn in July.

Examples of Chemical Changes

Chemical Changes

Chemical changes *do* alter the identity of a substance. In other words, a chemical change is when something changes into an _____. For example: Iron rusting, Wood burning, Copper turning to brass, Baking a cake, spoiled milk

Chemical properties-

These are properties that can only be observed by _____

A piece of paper burns and turns to a black substance. After the flame goes out you can no longer burn the new substance. The chemical properties have been changed.

Milk needs to be in the refrigerator or else it will go bad. If you've ever seen or smelled spoiled milk, it is not a pretty sight. The milk gets a sour odor and becomes lumpy. Unlike physical changes, you cannot reverse chemical changes. You

Common Errors: Ice melting, water freezing, water evaporating, and steam condensing are all examples of a state change. *These are _____ changes, not chemical. Diluting a solution is a _____ change, even if the color becomes more faint.

The Take Home Message

State changes, like melting, freezing, boiling, are all _____ changes.

The substance remains the same substance, it just changes what **STATE** it is in.

PROPERTY CHANGES

- 1** When water changes to ice, what kind of change has occurred?
 - A** A chemical change
 - B** A physical change
 - C** A train change
- 2** What type of change has occurred when a nail rusts?
 - A** A nuclear change
 - B** A physical change
 - C** A chemical change
- 3** What does it mean when there is a physical change?
 - A** Matter has changed from one substance into another
 - B** Matter has changed size, shape or form
 - C** Matter has morphed into anti-matter
- 4** What does it mean when there is a chemical change?
 - A** There is a change in the size or shape of an object
 - B** One substance has changed into another
 - C** A solid changes into a chemical
- 5** What is an example of a chemical change that happens inside your body?
 - A** Food being broken down by enzymes in your stomach
 - B** Food being broken into small pieces by your teeth
 - C** Your heart beating
- 6** What is an example of a physical change that happens inside your body?
 - A** Food being broken down by enzymes in your stomach
 - B** Food being broken into small pieces by your teeth
 - C** Your heart beating
- 7** What type of change is weathering?
 - A** A chemical change
 - B** A physical change
 - C** A seasonal changes
- 8** What chemical change produces table salt?
 - A** Sodium and chlorine react with one another
 - B** Pepper and sugar are mixed together
 - C** A piece of salt cane is crushed into tiny pieces
- 9** Which of these is a chemical change that occurs over a long period of time?
 - A** Adding chlorine to the pool
 - B** Ice cream melting
 - C** Metal rusting
- 10** What type of change has occurred when a glass breaks?
 - A** A chemical change
 - B** A physical change
 - C** A psychological change
