# Chp 14: Lect 2: Chemical Bonding: Part 1: Ionic Bonds & Ions

### Ions ions ions

We've also talked about ions....What is an ion? An ion is a \_\_\_\_\_ or an atom that has either \_\_\_\_\_ or \_\_\_\_\_ an \_\_\_\_\_. We also talked about how Sodium willingly gives away its lone valence electron. Chlorine very greedily takes that electron, in order to full its outer shell. Like we said, sodium & chloride are a match made in heaven. As sodium gives away its electron, it becomes a ion

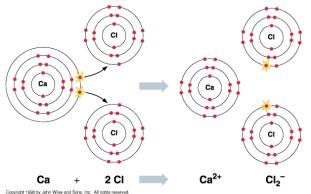

This is called a \_\_\_\_\_ When chlorine receives the electron, it becomes a \_\_\_\_\_\_ ion. This is called an \_\_\_\_\_\_. After the electron moves, the positive sodium ion is then immediately attracted to the negative chloride ion. Why are they attracted to teach other?

## Video1: Chemical Bonding & Atomic Structure

#### Ionic Bonds

This bond is called an ionic bond, because the electrons are from one atom to another, creating an

between \_\_\_\_\_ In other words, 1 element's atom is going to \_\_\_\_\_ electrons, and theother is going to \_\_\_\_\_ These bonds are not limited to a single pair of atoms. In NaCl, each Na+ is attracted to all of the neighboring chloride ions. Likewise, each Cl- is attracted to all the neighboring sodium

atoms. These ions form in a repeated, 3-dimensional pattern called a

\_\_\_\_\_ This means the positive and negative atoms are arranged in alternating patterns. This is why salt is formed in cubes.

## Ionic Bond Examples

The prime example of an ionic bond is NaCl, but there are many more examples of ionic bonds. Look how it takes 1 calcium atom to bond with 2 chlorine atoms. Also, notice how calcium is now  $Ca^{2+}$ . Why? Well, because calcium \_\_\_\_\_\_ electrons, leaving it with an overall charge of 2+. Conversely, each chlorine

electron, leaving each with an overall charge of 1-. This new compound would be written as

## Video #2: Ionic Bonding

## *Ions Example #2*

Here's another example. I've got two ions:  $H^{1+}$  and  $(SO_4)^{2-}$ . This time, the \_\_\_\_\_ (high #) represents the charge number. Remember that the subscript (low #) refers to the number of atoms. How many hydrogens does it take to pair with the sulfate ion (SO<sub>4</sub>)? Well, 2!. I need 2 positive charges to match the 2- charge. The final compound would be

## Video #3: Ionic Bonding with Sodium & Chlorine

Covalent	Ionic		
Electrons	Electrons		
Creates	Creates		
Bond consists of 2 electrons	Bonds form with all oppositely charged neighbors		

You Try It!	
-------------	--

Cation	Anion	Compound
Li <sup>1+</sup>	S <sup>2-</sup>	
Mg <sup>2+</sup>	Cl <sup>1-</sup>	
Al <sup>3+</sup>	(PO <sub>4</sub> ) <sup>3-</sup>	

#### Video #4: Ionic Bonding Review Metallic bond

Quickly... a metallic bond is the force of attraction between a positively charged and the

in a metal. Metals atoms are so tightly packed, their electron shells overlap This lets electrons move freely from one atom to another. THIS lets metal conduct electricity & change shape easily (ductility, malleability).

	o Questions:			

# **BrainPop Questions:** 1. What is an ion?

A. an atom with an extra neutron B. An atom	ms or molecule with an ele	ectrical charge C. The ou	utermost shell of an atom				
2. What is the nucleus of an atom made up of? A. No		Ũ					
	$\alpha$ protons $\beta$ . Fi						
3. What are the negatively-charged particles orbiting a	n atom called? A. Electro	ons B. Protons C. Neu	utrons				
4. When do ions form? A. When an atom loses a proton B. When 2 atoms bond together C. When an atom loses or grains an electron							
5. Electrons orbit the nucleus in layers called:	A. Valence clouds	B. Shells	C. Potentials				
6. Electrons in the outermost shell are called:	A. valence electrons	B. Ionization electrons	C. Orbital electrons				
7. What is the tendency to lose electrons called	A. Negative valence	B Ionization	C. Positive valence				
8. Atoms on the right side of the periodic table ten to:	A. Gain electrons easily	B. Lose electrons easily	C. Lose protons easily				
9. How do ions stick together? A. With covalent bonds B. With negative bonds C. With ionic bonds							
10. What happens to the ionic bond when sodium chloride is dissolved in water? a. The bond strengthens B. The bond breaks C. The bond is unaffected
