

# Motion Standards

A California Standards Review

## Motion

1. The velocity of an object is the rate of change of its position. As a basis for understanding this concept:
  - a. *Students know* position is defined in relation to some choice of a standard reference point and a set of reference directions.
  - b. *Students know* that average speed is the total distance traveled divided by the total time elapsed and that the speed of an object along the path traveled can vary.
  - c. *Students know* how to solve problems involving distance, time, and average speed.
  - d. *Students know* the velocity of an object must be described by specifying both the direction and the speed of the object.
  - e. *Students know* changes in velocity may be due to changes in speed, direction, or both.
  - f. *Students know* how to interpret graphs of position versus time and graphs of speed versus time for motion in a single direction.

## Notes

Read the following section highlights. Then, in your own words, write the highlights in your ScienceLog.

- An object is in motion if it changes position over time when compared with a reference point.
- The speed of a moving object depends on the distance traveled by the object and the time taken to travel that distance.
- Speed and velocity are not the same thing. Velocity is speed in a given direction.
- Acceleration is the rate at which velocity changes.
- An object can accelerate by changing speed, changing direction, or both.
- Acceleration is calculated by subtracting starting velocity from final velocity, then dividing by the time required to change velocity.

	Speed	Velocity	Acceleration
<b>Explanation in your own words:</b>	How fast something moves	How fast something moves in a specific direction	The rate at which something is either increasing or decreasing its velocity/speed
<b>Equation</b>	Speed = $\frac{\text{Distance}}{\text{Time}}$	Velocity = $\frac{\text{Distance}}{\text{Time}}$	A = $\frac{\text{Final Velocity} - \text{starting Vel.}}{\text{Time it takes to change Vel.}}$

## How do you know when something is in motion?

- You know something is moving when its position changes relative to another object
- You can see the background changing or moving

## How does average speed differ from speed?

- Most of the time, objects do not travel at a constant speed – but are constantly speeding up and slowing down
- Average speed takes that into account
- Speed is usually a measure of INSTANTANEOUS SPEED – or how fast an object is traveling at a specific moment

## Solving Speed Problems

- **Example:** What is the speed of a cheetah that travels 112.0 meters in 4.0 seconds?
- **Looking for:** Speed of cheetah
- **Given:**
- **Distance = 112.0 meters**
- **Time = 4.0 seconds**
- **Relationship:**

$$\text{speed} = \frac{d}{t}$$

Solution:

$$\text{speed} = \frac{d}{t} = \frac{112.0 \text{ m}}{4.0 \text{ s}} = \frac{28 \text{ m}}{\text{s}}$$

The speed of the cheetah is 28m per second

## You Try It!

- 1. A bicyclist travels 60.0 kilometers in 3.5 hours. What is the cyclist's average speed?
- Looking for cyclist's average speed
- Given:
  - Distance = 60 km / Time = 3.5 hours
- Relationships

$$\text{speed} = \frac{d}{t}$$

Solution: Speed = distance / time  
 = 60 km / 3.5 hours  
 = 17.14 km/hr

The speed of the cyclist is 17.14 kilometers per hour.

## You Try It!

- 2. What is the average speed of a car that traveled 300.0 miles in 5.5 hours?
- 300 miles / 5.5 hours = 54.54 mph
- 3. How much time would it take for the sound of thunder to travel 1,500 meters if sound travels at a speed of 330 m/s?
- 330 m/s = 1500 m / t
- 1500m / 330 m/s = t
- t = 4.54 seconds

## You Try It!

- 4. Suppose you are walking home after school. The distance from school to your home is five kilometers. On foot, you can get home in 25 minutes. However, if you rode a bicycle, you could get home in 10 minutes.
- a. What is your average speed while walking?
- 5 km/25 min = .2 km/min
- b. What is your average speed while bicycling?
- 5 km/10 min = .5 km/min
- c. How much faster you travel on your bicycle?
- .5-.2 km/min = .3 km/min faster

## Solving Velocity Problems

- Remember:** The velocity of an object is determined by measuring both the *speed* and *direction* in which an object is traveling.
  - If the **speed** of an object changes, then its **velocity** also changes.
  - If the **direction** in which an object is traveling changes, then its **velocity** changes.
  - A change in either speed, direction, or both causes a change in velocity.**
- You can use  $v = d/t$  to solve velocity problems. **The velocity of an object in motion is equal to the distance it travels per unit of time in a given direction.**

## Example 1: What is the velocity of a car that travels 100.0 meters, northeast in 4.65 seconds?

<b>Looking for:</b> Velocity of the car	<b>Solution</b> velocity = $\frac{d}{t} = \frac{100.0 \text{ m}}{4.65 \text{ s}} = \frac{21.5 \text{ m}}{\text{s}}$
<b>Given:</b> Distance = 100.0 meters Time = 4.65 seconds	The velocity of the car is 21.5 meters per second, northeast.
<b>Relationship:</b>	velocity = $\frac{d}{t}$

## You Try It!

- 1. An airplane flies 525 kilometers north in 1.25 hrs. What is the airplane's velocity?

- Looking for the airplane's velocity
- Given:
  - Distance = 525 km north
  - Time = 1.25 hours
- Relationship
- Solution
  - Velocity = d/t
  - = 525 km / 1.25 hours
  - = 420 km/hr

$$\text{velocity} = \frac{d}{t}$$

### You Try It!

- 2. A soccer player kicks a ball 6.5 meters. How much time is needed for the ball to travel this distance if its velocity is 22 meters per second, south?
- $22\text{m/s} = 6.5 \text{ m} / \text{time}$
- $6.5 \text{ m} / 22 \text{ m/s} = \text{time}$
- $t = .29 \text{ seconds}$

### You Try It!

- 3. A bus is traveling at 79.7 kilometers per hour east, how far does the bus travel 1.45 hours?
- $79.7 \text{ km/h} = D / 1.45 \text{ h}$
- $79.7 \times 1.45 = D$
- $D = 115.56 \text{ km}$

### You Try It!

- 4. A girl scout troop hiked 5.8 kilometers southeast in 1.5 hours. What was the troop's velocity?
- $V = 5.8 \text{ km} / 1.5 \text{ hours}$
- $V = 3.87 \text{ km per hours}$

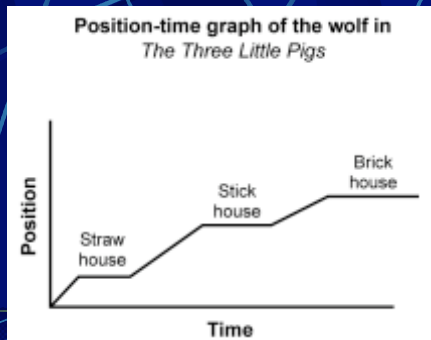

## Graphing Motion

### • Position-time graphs

- The graph on the next card represents the story of "The Three Little Pigs." The parts of the story are listed below.
- The wolf started from his house. The graph starts at the origin.
- Traveled to the straw house. The line moves upward.
- Stayed to blow it down and eat dinner. The line is flat because position is not changing.

- Traveled to the stick house. The line moves upward again.
- Again stayed, blew it down, and ate seconds. The line is flat.
- Traveled to the brick house. The line moves upward.
- Died in the stew pot at the brick house. The line is flat.

## Position-time graphs

## Speed-time graphs

- A speed-time graph displays the speed of an object over time and is based on position-time data.
- Speed is the relationship between distance (position) and time,  $v = d/t$ .
- For the first part of the wolf's trip in the position versus time graph, the line rises steadily.
- This means the speed for this first leg is constant. If the wolf traveled this first leg faster, the slope of the line would be steeper.

## Speed-time graphs

- The wolf moved at the same speed toward his first two "visits."
- His third trip was slightly slower.
- Except for this slight difference, the wolf was either at one speed or stopped (shown by a flat line in the speed versus time graph).

## Speed-time graphs

- The wolf moved at the same speed toward his first two "visits."
- His third trip was slightly slower.
- Except for this slight difference, the wolf was either at one speed or stopped (shown by a flat line in the speed versus time graph).
